

ShieldiT Use Case: Mobile, Tablet & Endpoint Threat Defense for Healthcare Networks

Industry:

Healthcare

Hospitals

Telemedicine

Clinical Operations

Overview

A nationally recognized, multi-state healthcare provider faced urgent **security and compliance challenges** as it expanded its mobile-first, tablet-enabled, and endpoint-driven care delivery model. With thousands of physicians, nurses, and administrative staff using smartphones, iPads/tablets, laptops, and connected clinical devices for electronic medical record (EMR/EHR) access, telemedicine, and patient coordination, the organization required a **secure, scalable solution** to protect against evolving cyber threats while maintaining compliance with **HIPAA, HITECH, GDPR, and NIST frameworks**.

The provider needed to safeguard sensitive **patient records (PHI)** and critical clinical data across both **corporate-owned and BYOD devices**, ensuring secure communications, endpoint protection, and governance. Special attention was required for **tablet-based EMR workflows, mobile messaging, Wi-Fi-driven care environments, and cross-facility collaboration**, where fragmented controls and unmanaged devices created unacceptable risks.

Challenges

Unprotected Endpoints Across Care Environments

iPads, Android tablets, smartphones, laptops, and connected IoT medical devices used for EMR/EHR workflows, telehealth, and patient rounds often lack standardized protections — creating critical entry points for attackers.

Escalating Mobile & Endpoint Threats

Frontline care teams are increasingly targeted by phishing (SMS, email, QR), spyware, and malicious healthcare apps designed to compromise patient records and disrupt clinical workflows.

Rogue Wi-Fi & Network Spoofing

Hospitals, clinics, and public care environments expose staff to MITM attacks via rogue access points and spoofed networks that can intercept communications and exfiltrate PHI.

Fragmented Visibility & Compliance Gaps

Security teams lack real-time visibility into risk posture, device compliance, and data access across thousands of distributed endpoints, including BYOD and remote staff.

Audit & Regulatory Exposure

Without centralized logging, policy enforcement, and secure retention, providers face audit failures and non-compliance with HIPAA, HITECH, GDPR, and NIST 800-53 standards.

Lack of Unified Secure Communications

Multi-disciplinary care teams (physicians, nurses, specialists, and administrators) often rely on unsecured messaging apps, creating uncontrolled communication channels and increasing the risk of data leakage.

Solution: ShieldiT Protect + ShieldiT Connect

ASPIS Cyber deployed an **integrated ShieldiT solution** combining **ShieldiT Protect (Mobile & Endpoint Threat Defense)** with **ShieldiT Connect (Secure Communications)** to create a **fully compliant, AI-native protection layer** across the healthcare network's entire endpoint ecosystem — including smartphones, tablets, laptops, BYOD devices, and connected medical IoT.

Together, these capabilities deliver a **zero-trust environment** that safeguards patient records (EHR/EMR), secures multi-disciplinary care team collaboration, and ensures audit readiness under HIPAA, HITECH, GDPR, and NIST frameworks.

Key Capabilities

End-to-End Compliance

- Phishing across SMS, email, apps, and QR codes.
- OS-level compromise, rooting/jailbreaking, and device tampering.
- Rogue Wi-Fi / man-in-the-middle (MITM) detection and blocking.
- Malicious app and behavioral anomaly detection in real-time.
- Continuous protection even in low-bandwidth or offline scenarios.

Comprehensive Endpoint Protection

- Full support for iPadOS, Android tablets, smartphones, laptops, and BYOD devices.
- Policy enforcement across clinical, administrative, and telemedicine workflows.
- Quarantine and conditional access for compromised or non-compliant devices.
- Optional hardening for IoT medical devices and connected hospital systems.

Encrypted, Role-Based Messaging & Calling

- End-to-end secure communications (voice, video, and messaging) across clinical teams
- Role-based communication controls by department, clearance, and function
- Federation with external specialists, consultants, and partners under strict policy restrictions

Compliance-Ready Oversight with ManageiT

- Unified dashboard for threat visibility, device compliance, and communication governance.
- Real-time alerts, audit logging, and compliance exports (HIPAA, HITECH, GDPR, NIST 800-53).
- Integrated **AuditBot** to track privileged actions, policy changes, and clinical device activity.

Microsoft Intune & Azure AD Integration

- Conditional access tied to MTD risk posture and device health.
- Seamless onboarding via existing corporate identity providers (Azure AD/Entra ID, SAML, OIDC).
- Automated remediation and policy enforcement across endpoints.

Results & Impact

End-to-End HIPAA, HITECH & GDPR Compliance

All mobile, tablet, laptop, and BYOD traffic fully encrypted, logged, and auditable — ensuring continuous compliance across clinical and administrative environments.

Significant Reduction in Mobile & Endpoint Phishing

Rapid decrease in phishing, rogue Wi-Fi, and malicious app incidents within the first 90 days of deployment, strengthening patient record protection and minimizing clinical disruptions.

Enterprise-Wide Protection at Scale

Thousands of clinicians, staff, and administrators secured across multiple hospitals, clinics, and remote care facilities — covering smartphones, tablets, laptops, and connected IoT endpoints.

Secured Clinical Workflows & Patient Records

EMR/EHR access, telehealth sessions, prescription systems, and care coordination all protected with role-based access controls and on-device AI-driven threat defense.

Proven Audit Readiness

Independent audits under HIPAA, HITECH, and NIST 800-53 frameworks confirmed continuous compliance with **zero endpoint security gaps identified.**

Zero-Trust Enforcement Without User Friction

Device posture checks, conditional access, and auto-remediation applied in real time — maintaining seamless clinical workflows while enforcing strict security.

Why It Matters

Healthcare organizations are rapidly evolving into **mobile- and endpoint-first environments**, where smartphones, tablets, laptops, and connected medical devices are indispensable for clinical care. These tools improve patient outcomes and operational efficiency — but they also represent one of the **largest attack surfaces** in modern healthcare.

ShieldiT Protect + Connect empowers healthcare providers to:

- ✓ Safeguard **clinical workflows and patient records (PHI/EHR)** across all endpoints — mobile, tablets, laptops, BYOD, and IoT.
- ✓ **Prevent breaches before they happen** with on-device AI-driven threat detection and zero-trust enforcement.
- ✓ Maintain **continuous visibility and compliance** across hospitals, clinics, and remote care facilities.
- ✓ Support **HIPAA, HITECH, GDPR, and NIST frameworks** without compromising usability or slowing down care delivery.

By unifying **secure communications, endpoint protection, and compliance governance** in a single platform, ShieldiT enables healthcare providers to **protect patients, preserve trust, and deliver modern care securely at scale.**
