

ShieldiT Defense

Complete Secure Communications and Mobile Threat Defense for Mission-Critical Government and Defense Operations

Executive Summary

Governments, defense agencies, and critical infrastructure operators face increasingly sophisticated cyber threats targeting mobile devices, secure communications, and sensitive field operations. **ShieldiT Defense by ASPIS Cyber** is a purpose-built, complete cybersecurity platform that combines advanced end-to-end encrypted communications, robust mobile threat defense (MTD), and stringent infrastructure controls designed for national security and mission-critical use cases.

Delivering military-grade protection, ShieldiT Defense supports fully isolated deployments, secure offline operations, and on-device advanced threat detection. The platform empowers agencies to protect communications and endpoints in both connected and air-gapped environments, ensuring operational security without compromising mission readiness.

Key Use Cases

Secure Command Communications

End-to-end encrypted voice, video, messaging, and file sharing for leadership, command centers, and operational units.

Air-Gapped and Disconnected Deployments

Full operational capability in air-gapped or denied-network environments with secure offline synchronization.

National Data Sovereignty

Full control over data residency, encryption keys, and infrastructure, with private cloud or on-premise options.

Mobile Threat Defense for Field Operations

On-device detection and prevention of phishing, malware, rogue networks, and device compromise in tactical and hostile environments.

Hardened Device Provisioning

Deployment-ready ShieldiT Black devices preconfigured for high-risk operational roles and mission-specific policies.

Rapid Mission Deployment

Fast provisioning and configuration to support urgent operational requirements and short-notice mission readiness.

Core Features

End-to-End Encrypted Communications

AES-256 encrypted chat, voice, video, and file sharing using Olm and Megolm protocols with Double Ratchet key management, supporting forward and backward secrecy.

Offline Sync and Deferred Communications

Securely queue and synchronize messages in low-connectivity or denied-network environments without compromising encryption integrity.

On-Device Mobile Threat Defense

AI-powered detection against phishing, malicious apps, rogue networks, and device compromise, processed entirely on the device to eliminate cloud dependency.

ShieldiT Black Hardened Devices

Fully managed, preconfigured Android devices with hardened OS, policy lockdowns, and mission-specific security profiles.

Core Features

Dedicated Deployment Options

Isolated cloud, private cloud, or fully on-premise infrastructure with air-gapped capabilities for high-assurance and classified environments.

ManageiT Command Console

Granular control of users, devices, and security policies, with real-time alerts, remote intervention, and operational visibility.

Optional AuditBot Compliance and Oversight

Available for deployments that require continuous auditing of device events, communication activity, and administrative actions while adhering to heightened security policies.

Custom Policy Enforcement

Ability to define and enforce mission-specific security policies, authentication requirements, and operational restrictions at the device and network level.

Key Differentiators for Government and Defense Deployments

Dedicated, Isolated Environments

Provisioned on fully dedicated infrastructure, including on-premise, air-gapped, or secure government cloud environments such as AWS GovCloud. No shared tenancy or cross-customer federation unless explicitly authorized.

Strict Compliance Standards

Designed to meet defense-grade frameworks including FedRAMP, NIST, CMMC, and FIPS 140-2. Managed exclusively by cleared personnel, with third-party analytics and external telemetry forwarding disabled by default.

Custom Development and Integration

Tailored engineering services for integration with legacy mission systems, custom authentication methods such as CAC/PIV, policy customization, and deployment on hardened or specialized device platforms.

Secure Communications + Threat Defense

Unified platform combining encrypted communications, on-device mobile threat defense, offline operational controls, high-assurance security policies exceeding commercial standards.

Mission-Ready Deployment Models

Configurable for rapid mobilization in classified or high-threat environments, supporting full operational capability in both connected and disconnected states.

Turnkey National Security Solution

More than a license, ShieldiT Defense is delivered as a fully engineered, compliant, and secure operational platform for national-level defense and mission-critical operations.

Architecture Overview

ShieldiT Defense is built on a **microservices-based architecture** with containerized services orchestrated via **Kubernetes**, deployed in fully isolated environments for maximum security.

The platform supports **private cloud, air-gapped deployments**, and integration with **hardened mobile devices** for classified and high-assurance use cases. It natively integrates with secure government identity frameworks such as **SAML** and **OIDC**, and can operate with **full autonomy** when disconnected from external networks.

Licensing and Delivery Model

Dedicated Licensing Model

Per-user, annual licensing for fully dedicated and isolated environments.

Hardware-Integrated Options

ShieldiT Black hardened devices with preloaded secure configurations available as part of the deployment package.

Flexible Infrastructure Deployment

Support for air-gapped, on-premise, or sovereign private cloud environments to meet national security requirements.

Multi-Year Contracts

Long-term agreements aligned with defense procurement and budgeting cycles.

Implementation and Training Services

Guided onboarding with technical training for operational teams to ensure rapid adoption and mission readiness.

Service Level Commitments

SLA-backed performance, uptime, and support response times tailored to high-security operational requirements.

Conclusion

ShieldiT Defense provides unmatched mobile communications security and endpoint protection purpose-built for government, defense, and critical infrastructure operations. By combining hardened infrastructure, mission-ready encrypted communications, and advanced on-device threat detection, ShieldiT Defense enables agencies to maintain operational security in the most demanding and high-threat environments.
